

- Two types of packet switching:
 - Datagram (such as today's Internet)
 - Virtual circuit (such as Frame Relay, ATM)

communications network.

- In a switched communications network, data entering the network from a station are **routed** to the destination by being switched from node to node.

- Circuit switching
- Packet switching

- **Data transfer phase**
- Circuit disconnect/ **teardown phase**
 - Deallocate the dedicated resources
- The switches must know how to find the route to the destination and how to allocate bandwidth (channel) to establish a connection.
